Core Topics Covered in 7th Grade Life Science Review

The 7th-grade life science curriculum typically encompasses several key areas. Below, we explore each in detail, providing explanations and insights that clarify the material students are expected to learn.

- Cell Structure and Function

What Are Cells?

Cells are the fundamental units of life. All living organisms are made up of cells, which carry out necessary biological processes. There are two main types: prokaryotic (without a nucleus, e.g., bacteria) and eukaryotic (with a nucleus, e.g., plants and animals).

Cell Parts and Their Functions:

Understanding cell structures is crucial. Key organelles include:

- Nucleus: Acts as the control center, containing genetic material (DNA).
- Cytoplasm: Gel-like fluid where organelles are suspended and chemical processes occur.
- Cell Membrane: Regulates what enters and exits the cell.
- Mitochondria: Powerhouses that generate energy.
- Chloroplasts: Found in plant cells, these convert sunlight into energy through photosynthesis.
- Vacuoles: Store nutrients, waste products, or water.

Differences Between Plant and Animal Cells:

While both are eukaryotic, plant cells have unique features such as cell walls and chloroplasts, which animal cells lack.

- Ecosystems and Habitats

What Is an Ecosystem?

An ecosystem comprises living organisms interacting with their physical environment. Examples include forests, ponds, deserts, and grasslands.

Components of Ecosystems:

- Biotic Factors: Living components like plants, animals, fungi, and microorganisms.
- Abiotic Factors: Non-living elements such as sunlight, water, soil, and temperature.

Energy Flow and Food Chains:

Energy flows through ecosystems via food chains and webs, illustrating who eats whom. Key concepts include producers (plants), consumers (herbivores and carnivores), and decomposers (fungi and bacteria).

Importance of Biodiversity:

A diverse ecosystem maintains resilience, stability, and productivity. Protecting biodiversity ensures the sustainability of ecosystems.

- Heredity and Genetics

Basics of Heredity:

Heredity refers to the passing of traits from parents to offspring. Genes, located on chromosomes within the nucleus, carry these traits.

Mendelian Genetics:

Gregor Mendel's experiments with pea plants laid the foundation for understanding dominant and recessive traits. Key terms include:

- Genes: Units of heredity.
- Alleles: Different forms of a gene.
- Dominant and Recessive Traits: Traits expressed over others or hidden.

Punnett Squares:

A tool to predict the probability of inheriting particular traits.

Genetic Variation and Its Significance:

Variation results from mutations, gene shuffling during reproduction, and other factors, enabling populations to adapt over time.

- Classification of Living Things

The Taxonomic Hierarchy:

Living organisms are classified into groups based on shared characteristics:

- Domain
- Kingdom
- Phylum
- Class
- Order
- Family
- Genus
- Species

Major Kingdoms:

- Bacteria: Single-celled prokaryotes.
- Protists: Mostly single-celled eukaryotes.
- Fungi: Decomposers like mushrooms.
- Plants: Photosynthetic, multicellular organisms.
