- Use a min-heap of size k to track the k largest elements efficiently.
- Alternatively, apply the Quickselect algorithm, which partitions the array similarly to Quicksort, to find the kth largest with average linear time.

Steps:

- Check input constraints.
- Choose the appropriate method based on data size.
- Implement the algorithm, ensuring correct handling of edge cases.

Optimization tips:

- Use built-in heap libraries for simplicity.
- For large datasets, Quickselect offers better average performance.

Problem 2: Detect a Cycle in a Graph

Approach:

- Use Depth-First Search (DFS) with recursion or a visited states array.
- Maintain a recursion stack to detect back edges, which indicate cycles.

Steps:

- Represent the graph using adjacency lists.
- Perform DFS from each unvisited node.
- During DFS, mark nodes as visited and part of the recursion stack.
- If a node is encountered that is already in the recursion stack, a cycle exists.

Optimization tips:

- Use iterative DFS if recursion depth is a concern.
- For directed vs. undirected graphs, adapt cycle detection accordingly.
