QuestionAnswer What is Ohm's Law and how is it applied in basic electronics? Ohm's Law states that the current flowing through a conductor between two points is directly proportional to the voltage across the two points, expressed as $V = IR$. It is used to calculate resistance, voltage, or current in electronic circuits. Explain the difference between a resistor and a capacitor. A resistor opposes the flow of current, converting electrical energy into heat, and is used to control current. A capacitor stores electrical energy temporarily in an electric field and is used for filtering, timing, and energy storage in circuits. What is a diode and how does it work? A diode is a semiconductor device that allows current to flow in one direction only. It works based on the PN junction, permitting current flow when forward biased and blocking it when reverse biased. Define what a transistor is and mention its types.
