Common Network Infrastructure Lab Scenarios and Solutions

Below are typical scenarios encountered in lab exercises, along with detailed solutions to guide your understanding.

Scenario 1: Basic Router and Switch Configuration

Objective: Configure an IP address on a router interface and enable connectivity between two devices.

Steps:

- Access the router CLI.
- Enter global configuration mode:

```
``plaintext
```

```
configure terminal
```

```
```
```

- Configure the interface:

```
``plaintext
```

```
interface GigabitEthernet0/0
```

```
ip address 192.168.1.1 255.255.255.0
```

```
no shutdown
```

```
exit
```

```
```
```

- Verify interface status:

```
``plaintext
```

```
show ip interface brief
```

```
```
```

- Test connectivity with a connected device:

```
``plaintext
```

```
ping 192.168.1.2
```

```
````
```

Answer tips:

- Ensure the interface is enabled (`no shutdown`).
- Confirm IP addresses are in the same subnet if devices are directly connected.
- Use `show ip route` to verify routing tables if routing is involved.

Scenario 2: Setting Up a Static Route

Objective: Configure a static route on Router A to reach a network behind Router B.

Solution:

- On Router A:

```
``plaintext
```

```
configure terminal
```

```
ip route 10.0.2.0 255.255.255.0 192.168.1.2
```

```

```

```
ip address 192.168.1.2 255.255.255.0
```

```
no shutdown
```

```
...
```

- Verify connectivity:

```
``plaintext

```
...
```

Key points:

- Static routes specify the destination network, subnet mask, and next-hop IP.
- Confirm interfaces are active before testing.

### Scenario 3: Configuring OSPF Routing Protocol

Objective: Enable OSPF between multiple routers for dynamic routing.

Solution:
