- **Control Activation:** Operator uses control valves to direct compressed air to the desired pneumatic cylinders.

- **Cylinder Movement:** The pressurized air pushes the piston within the cylinder, resulting in linear motion that lifts or lowers the load.

- **Load Handling:** The load hook is attached to the load, and movement is controlled to position the load accurately.

- **Return and Reset:** Releasing the control valve allows air to escape or be redirected, causing the piston to return to its original position, ready for the next operation.

This cycle enables the crane to perform lifting, lowering, and positioning tasks efficiently with minimal energy loss.

In a gear train, Gear A has 20 teeth, and Gear B has 40 teeth. If Gear A rotates clockwise at 100 RPM, what is the rotation speed and direction of Gear B?

Solution:

$$\text{Speed ratio} = \text{Number of teeth on Gear B} / \text{Number of teeth on Gear A} = 40 / 20 = 2$$

Gear B will rotate at $100 \text{ RPM} / 2 = 50 \text{ RPM}$, and due to gear engagement, the direction will be opposite (counterclockwise).
