Introduction to Feedback Control Systems

Feedback control systems are mechanisms that automatically adjust their operations based on the difference between a desired setpoint and the actual output. These systems are pervasive in everyday life, from thermostats regulating room temperature to autopilots guiding aircraft. The fundamental goal is to ensure the system's output closely follows the desired reference, despite external disturbances or internal variations.

Introduction to Feedback Control in Biological Systems

Understanding Feedback Control

Feedback control is a process by which a system self-regulates its output to maintain stability, accuracy, and efficiency.
